

Using Any Video Converter

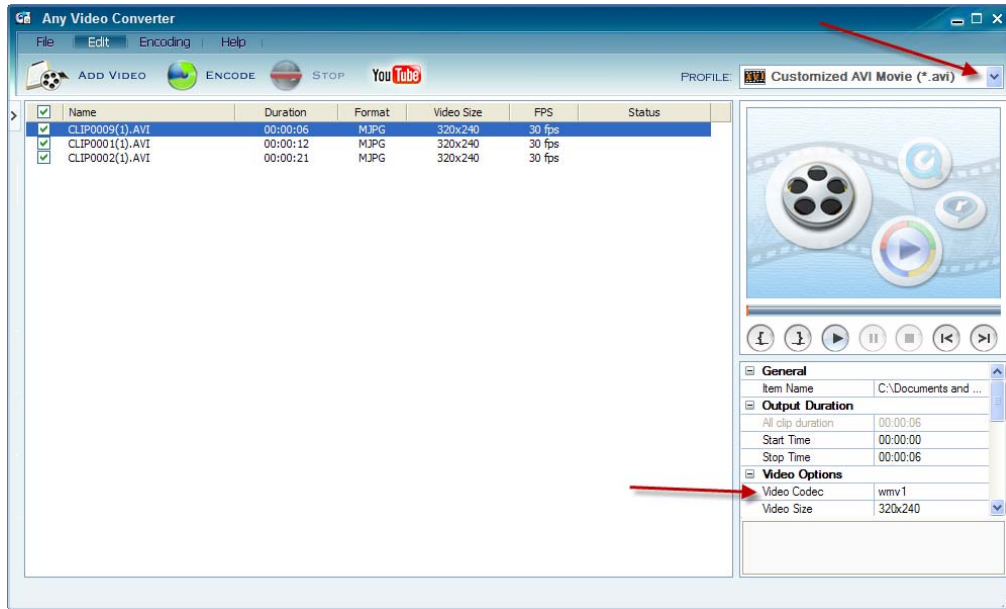

1. If you do not already have Any Video Converter on your computer go to <http://www.any-video-converter.com/download/> and scroll to the bottom of the page to the free version and download onto your computer. Make sure to save the program on your desktop for easy access.

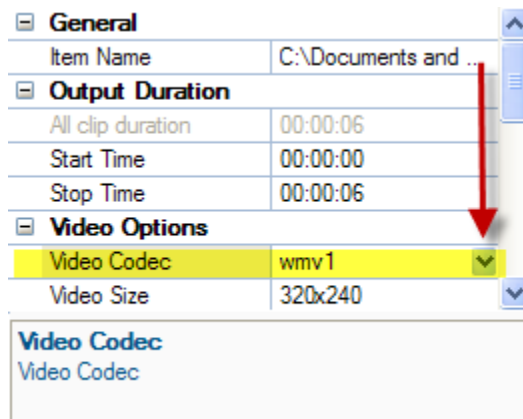

2. Click on Any Video Converter on your desktop to open the program.
3. Click on “Add Video” icon in upper left corner of the screen.
4. Select the folder on your desktop that you saved your media to. Click on the individual clips to import into Any Video Converter.

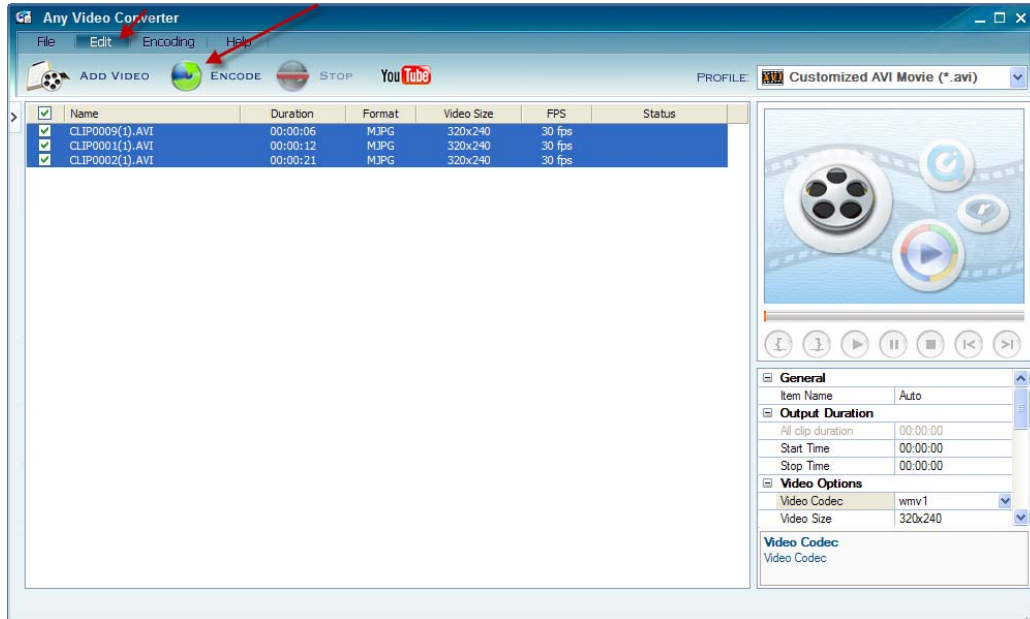

5. Your clips will appear in the main window. Once all of your media clips are listed in the main window, you must set your preferences. There are two preference settings that are key to the conversion working properly. First, you must select “Customized AVI Movie” from the upper right hand corner profile drop down menu.

6. Second, under Video Options in the lower right screen click on “Video Codec”. A drop down arrow will appear on the right, click to reveal the drop down menu and select “wmv 1”.

7. At the top of the window left click on “Edit”. Scroll down and click on “Select All”. The video clips in the main window should all be highlighted in blue. Next, click on the “Encode” icon at the top of the window. Progress can be tracked for each clip under the status icon. The word completed will be listed under status next to each clip when it is finished.

8. Click on File at the top of the screen and select “Set Out Put”. Choose a folder in which to store your new video clips for editing.
